

# ABSTRACT

In a hose with corrugated metal tube, a connecting pipe is formed with a tapered inner surface in a tip end portion thereof, a corrugated metal tube is formed with a flared portion flaring so as to correspond to the tapered inner surface of the connecting pipe, and a mating pipe is formed with a tapered outer surface. The hose with corrugated metal tube is connected to the mating pipe by a cap nut so that the tapered inner surface of the connecting pipe abuts the tapered outer surface of the mating pipe with the flared portion therebetween.
